Experiment No:01 **Roll No:69**

Aim: Program to find the union of two lists.

Code: -

```
def area():
    while(1):
        print("1.triangle \n 2.rectangle \n 3.circle \n 4.exit")
        ch=int(input("enter the choice"))

        if(ch==1):
            base=int(input("enter the base value"))
            height=int(input("enter the height value"))
            area=1/2*base*height
            print("area of triangle is",area)
        elif(ch==2):
            lenght=int(input("enter the lenght value"))
            width=int(input("enter the width value"))
            area=lenght*width
            print("area of rectangle is",area)
        elif(ch==3):
            radius=int(input("enter the radius value"))
            area=3.14*radius*radius
            print("area of circle is ",area)
        elif(ch==4):
            print("exit")
        else:
            print("worng input")
```

area()

Output:

```
agpit@DsLab:~/SY_50$ /usr/bin/python3 /home/agpit/SY_50/area_of_shapes
1.Circle
2.Triangle
3.Rectriangle
4.exit
enter your choice: 1
